

## April Cattle Survey – Data Accuracy

Letter Rating	CV	Rating
A	0.00% to 4.99%	Excellent
B	5.00% to 9.99%	Very good
C	10.00% to 14.99%	Good
D	15.00% to 24.99%	Acceptable
E	25.00% to 34.99%	Use with caution
F	$\geq 35.00\%$	Too unreliable to publish

The variability in the estimates can be obtained by constructing confidence intervals around the estimate using the estimate and the coefficient of variation.

The overall response rate of the survey is very good ranging normally from 97 to 99%, and item non-response is low. Overall, the impact of the edits and imputations is small. The data are generally of excellent quality, with some under-coverage due to intercensal frame degradation (i.e. coverage of new operations).
